

Self-excited vibrations in gyroscopic systems

By Gottfried Spelsberg-Korspeter

Shaker Verlag Dez 2007, 2007. Taschenbuch. Book Condition: Neu. 211x149x4 mm. Neuware - Self-excited vibrations are an unwanted phenomenon in many technical applications. Frequently they occur in moving media that are in frictional contact with other structures. Important examples for these kind of structures are moving belts, band saws, disk brakes, clutches and many more. The aim of this thesis is to make a contribution towards a convenient mathematical treatment of these problems. In a first part of the thesis linear discrete gyroscopic systems under the influence of nonconservative forces are studied. Following ideas of Seyranian and his coworkers perturbation theory is applied in order to obtain analytical approximations to the stability boundaries of these kinds of systems. The subsequent chapters of the thesis deal with the introduction of frictional contact into continuous models originating from the theory of elasticity. As a preliminary example an elastic rod is considered to prepare the derivation of the equations of motion using variational principles in the context of non material transition conditions originating from the frictional contact. The following chapter deals with a moving beam sliding through frictional pins. The equations of motion are derived from the basics of the theory of elasticity...

Reviews

The publication is easy in read through safer to comprehend. It is actually loaded with wisdom and knowledge Its been printed in an extremely simple way and is particularly simply right after i finished reading through this pdf where actually modified me, affect the way i believe.

-- **Ms. Clementina Cole V**

This is the very best publication i have got read until now. It is definitely simplified but shocks within the fifty percent of the pdf. You may like how the article writer create this pdf.
