Forgotten Books, United States, 2015. Paperback. Book Condition: New. 229 x 152 mm. Language: English . Brand New Book ***** Print on Demand *****.Excerpt from Transactions and Proceedings and Report of the Royal Society of South Australia, Vol. 7: For 1883-84 An examination of the different rock masses which compose the Australian Alps reveals many interesting geological features, not only in respect to their stratigraphical relations, but in the evidences of long-continued denudation which has laid bare the deep-seated crystalline schists and their intrusive rock masses. The surface configuration over which the sectional line has been determined is most varied, passing from the porphyritic bosses of the rugged Cobberas Mountains, across the Upper Silurian slates and marble-beds in the valley of Limestone Creek, through the metamorphic schist and granites of the Mitta-Mitta source-basin and its included Omeo plains and tableland, to the Main Dividing Range; thence across the deep gorge formed by the Dargo River (where the metamorphic schists merge into unaltered Lower Silurian slates and sandstones) to the basaltic tableland of the Dargo high plains, which has sealed up the river valleys of Miocene age. The lithological characters of the different rock masses are as follows: - At A are a series of open mossy upland flats, forming a low gap in the Main Dividing Range. These flats are made up of deposits of Tertiary or Post-Tertiary gravels, containing stream-tin and fine gold, and rest on a bottom of decomposing granite. The gravels are overlain by a moderate depth of alluvium, held together by the thin wiry interlaced roots of various Alpine shrubs. Samples of stannite in a quartz matrix have been found in the ridges in situ, indicating a probable lode not far distant. On the spurs from Mount Pilot the granite merges upward into a coarse granitoid...
